I've been reading a lot about the 'defects' of Java's approach to the Null object pattern and I've been wondering if my'reading' was accurate. The negative feedback on the pattern seems to be centered on maintainability and how the lack of structural typing affects design patterns. One of the more technical feedbacks was how the lack of structural typing for the default behavior of an object results in 'code smells'. I get that to a degree, but I've also been thinking about what I could view as correct design for the patterns. For example, how an initial conversation with a customer is similar to an architect, who you meet on a site visit and try to solve their problems for them in one presentation: Customer: "we want this" Architect: "ok, how should it work?" Customer: "we want this" Architect: "ok, so what would happen if we implemented it that
